The Immutable Laws of Software Development

Software Engineering’s Persistent Problems - 1

Exponential rise in cybersecurity vulnerabilities due to defective software

Unacceptable cost, schedule, and quality performance of legacy systems modernization and Enterprise Resource Planning (ERP) projects
Software Engineering’s Persistent Problems - 2

Cost of finding and fixing software bugs (i.e. scrap and rework) the number one cost driver in software projects

Arbitrary and **unrealistic schedules** leading to a culture of “deliver now, fix later”
Software Engineering’s Persistent Problems - 3

Inability to scale software engineering methods even for medium size systems

Lack of understanding of the impact of variation in individual productivity

Absence of work place democracy and joy in work
The Appetite for Assured Software

The organizational appetite for assured software is driven by the net losses realized from compromised software.

The consumer has been living with nearly 60 years of poorly developed and incompetent software.

Hundreds of millions of dollars are spent annually on post software compromise and incident recovery, lost opportunities and productivity (ask me).

Insecure software represents a pervasive kinetic threat to critical infrastructure and our way of life.....make no mistake about it.

The prudent approach is to take a proactive one. That is, software assurance measures must be a top integration priority in the enterprise cyber security risk management schema.

Feel my pain. Lack of a good software assurance program is a painful experience

At one time – 127 applications were tested and;
- 81 (64%) contained high vulnerabilities that facilitated exposure of sensitive data or system take over;
- 45 applications (36%) exposed Personally Identifiable Information (PII)

At another time – 50 applications were tested and;
- 41 applications (82%) hosted OWASP top 10 defects
- 5 applications (10%) taken offline due to high risk
- 19 (38%) contained high vulnerabilities that facilitated exposure of sensitive data or system take over
- 12 applications (24%) exposed PII

Emerging Cyber Threats Call for a Change in the ‘Deliver Now, Fix Later’ Culture of Software Development

By Girish Seshagiri, CEO of Advanced Information Services Inc. (AIS)

The demand for new and innovative technology solutions has created a software industry laser focused on speed to market, costs and product functionality. While this may help companies achieve a first-to-market advantage, it has also led to an environment where developers are more focused on meeting unrealistic schedule commitments than producing high-quality software.

necessary to permanently reduce the number of vulnerabilities found in their products.”

Commit to Quality, Reduce Risk
Well-publicized software failures in recent times have been spectacular. We want these failures to become the exception instead of the norm. We want to encourage a thriving industry that easily enables quality work.

Common Misconceptions -1

We must start with firm requirements
If it passes test, it must be OK
Software quality can’t be measured
The problems are technical
We need better people
Software management is different

Source: Managing the Software Process, Watts Humphrey, Addison Wesley, 1989
Common Misconceptions – 2

Maturity level 3 is all that is needed
Higher maturity levels add to cost
Higher maturity levels are needed only for safety critical or business mission critical systems
If it is “agile” or “lean”, it is good
What we need are lean processes
Maturity levels guarantee results
Maturity level 5 is the end
The Real Question

Whose Process Is It?
Why? - 1

Why do development teams agree to delivery schedule they know they can’t meet?

Why don’t C-level executives realize that poor quality performance is the root cause of most software cost and schedule problems?

Why doesn’t the government hold contractors liable for software defects and vulnerabilities?
Why?  - 2

Why does the software applications development industry believe that **quality increases costs and schedule**?

Why do we continue to rely on **test as the principal defect removal** method?

Why do we continue to rely on monthly status reporting when we know that projects get to be **one year late one day at a time**?
Is Healthcare.Gov the Exception?

SAM.Gov?
USAJobs.Gov?
TSP.Gov?

Can you guarantee the cost, schedule, and quality outcomes of your current projects?
Have You Considered?

Quality work is more predictable

Unhappy people rarely do quality work

Without quality, agility is in name only

Quality without numbers is just talk
The number of development hours will be directly proportional to the size of the software product.
When acquirers and vendors both “guess” as to how long a project should take, the acquirers’ “guess” will always win.

Customers’ Dilemma
- Want their product now at zero cost.
- Due to time-to-market pressures, time frames are arbitrary and unrealistic for the software team to produce a product that works.

Developers’ Choices
- Try to “guess” what it would take to win the business.
- Or make a commitment based on a plan and what the organization can do based on organization historic data.
Immutable Laws of Software Development – 3

➤ When management compresses schedule arbitrarily, the project will end up taking longer
When poor quality impacts schedule, schedule problems will end up as quality disasters

Maryland officials were warned for a year of problems with online health-insurance site

"We didn't know it would be broken when we turned it on"
Immutable Laws of Software Development – 5

- The less you know about a project during development, the more you will be forced to know later

When test is the principal defect removal method during development, corrective maintenance will account for the majority of the maintenance spend.
The number of defects found in production use will be inversely proportional to the percent of defects removed prior to integration, system, and acceptance testing.

Regional Centers of Excellence for Secure Software

Central Illinois pilot

An industry-led approach to training and skills formation for secure software development

Goals

Using industry-defined competencies and requirements as well as a standardized curriculum to create highly-skilled, capable, and readily employable graduates.

Creating a registered apprenticeship program, in which students receive competency based certification along with an associate degree and other accreditations.

Connecting education to a middle class job, in which employers provide tuition reimbursement, school stipends, and an increasing hourly wage for the duration of the training and apprenticeship.

Joy in Work

“There is a square; there is an oblong. The players take the square and place it upon the oblong. They place it very accurately; they make a perfect dwelling place. Very little is left outside. The structure is now visible; what was inchoate is here stated; we are not so various or so mean; we have made oblongs and stood them upon squares. This is our triumph; this is our consolation.”
