Introduction

Definitions

• Risks (IEEE Std 1540-2004; Standard for Software Life Cycle Processes)
  – Program and project risks are the likelihood of an event, hazard, threat, or situation occurring and its undesirable consequences
• Risk (Project Management Body of Knowledge PMBOK)
  – An uncertain even or condition that, if it occurs, has a positive or negative effect on project’s objectives
• Issues (QATAR National Project Management)
  – An issue is something currently happening that is having a negative impact on the project and requires resolution for the project to proceed successful
• Issues
  – An issue can be associated with a risk if the risk is realized; has occurred
• Opportunity (The American Heritage Dictionary)
  – A favorable or advantageous combination of circumstances
  – A chance for progress or advancement
• Opportunity (PMBOK)
  – A condition or situation favorable to the project, a positive set of circumstances, a positive set of events, a risk that will have a positive impact on project objectives, or a possibility for positive chances
Introduction

Definitions

• Risk Response
  – The process of developing options and actions to enhance opportunities and reduce threats to project objectives PMBOK
  – Includes Mitigation and Contingencies
  – Includes acceptance of the risk or issue consequence

• Mitigation
  – Risk mitigation implies an elimination or reduction in the probability of risk occurrence PMBOK

• Contingency
  – Issue contingency implies an elimination or reduction of the impact of issues or alternative actions taken
Introduction

Opportunity
- New weapon system
- New spacecraft
- New micro processor
- New restaurant

**Risks**
*When attempting a new invention, activity, or project you are taking advantage of an opportunity. But there is always an element of risk associated with these ventures

Issues
- When risks are realized, occur, they become issues
- Issues could arise without being associated with an identified risk

Opportunity
Resolving the risk, or correcting the issue, could surface opportunities to make corrections to keep these risks/issues from recurring (called process improvement)

*Managing Risks, Methods for Software Systems Development; Dr. Elaine M. Hall, SEI Series in Software Engineering*
**Focus of this presentation**

Risk Management Process

• Risk Management is an overarching process that encompasses
  – Risk Planning
  – Risk Identification
  – Risk Analysis
  – Risk Response
  – Risk Monitoring and Control

Continuous Monitor and Control Risk

Al Florence - MITRE
A risk is identified and submitted by staff member.

The risk is accepted or rejected. If rejected, a reason is provided to the risk submitter.

Risk analysis is conducted by SMEs.

If the risk is valid, risk management continues.

If not, the risk is rejected and closed.

If not, the risk is rejected and closed.

Continuous Risk Monitoring and Control

Al Florence - MITRE
Risk Management Flow

Enter

Is Risk Valid

Risk management continues by new owners of the risk

Risk may have been overtaken by events or may have diminished

Does the risk need to be transferred or escalated at this time?

Due to continuous monitoring is the risk still valid?

Willing to accept consequence of risk at this time?

Due to continuous monitoring are Mitigation Strategies required at this time?

Accept consequence of risk

Accept Risk Consequence

Execute Mitigation Strategies

No

When the risk has been mitigated or is no longer a threat it is closed
Risk Management Planning

- Risk management planning is the process of deciding how to approach and conduct the risk management activities for a project.
- Planning is important to:
  - Ensure the level, type and visibility of risk management are commensurate with both the risk and importance of the project to the organization.
  - Provide sufficient resources and time for risk management activities.
  - Establish an agreed-upon basis for evaluating risks.
- Risk planning should be completed early during project planning.

PMBOK
Risk Management Plan

- Risk management planning needs to be part of project planning
- A risk management plan can be a stand alone plan or part of the project plan
- The risk management plan needs to be tailored to the scope of the application
- The concepts provided in this tutorial can be used to develop the plan

**Risk Management Plan Outline**

- Introduction
- Project Description
- Risks/Issue/Opportunity Descriptions
- Risk Identification
- Risk Analysis
- Risk Response
  - Risk Acceptance
  - Risk Avoidance
  - Risk Transfer
  - Risk Escalation
  - Risk Mitigation
- Risk Monitor and Control
- Risk Register
- Issue Management
- Issue Contingency
- Risk/Issue Training
- Glossary
- References
Risk Identification

• Risk Identification is the activity that:
  – Identifies potential and current risks
  – Examine elements of the program to identify associated potential root causes of risks
  – Risk identification begins as early as possible in successful programs and continues throughout the life of the program

• Risk can be associated with all aspects of a program; e.g.

  Requirements  Design  
  Threat  Schedule  
  Security  Cost  
  Technology maturity  Performance  
  Supplier capability  Etc.
Risk Description

- A well-written risk statement contains three main components:
  - **Cause** – The negative *conditions* that currently exist relative to the risk
    - Identification of root cause(s) of the risk
    - This provides justification that a risk exists
  - **Probability of Occurrence** – The *likelihood* of the occurrence of the risk
    - Within a future time frame
    - Or a future event
  - **Consequence** – The *effect(s)*, negative impact(s) to the program(s) in case the risk occurs
    - The consequence should be related to at least cost, schedule, scope and performance
    - Consequence could also result in opportunities that may surface in correcting the problems
Risk Description

• The risk is written in a chain of: Cause: IF; THEN

Example

An Interface Working Group has not been formed and a plan to form one does not exist.

IF key stakeholders cannot agree on interface protocol by 2/26/2013; THEN the schedule for development and delivery will be delayed causing cost overruns.

NOTE: The cause includes assurance that the reason for the risk is valid. I.e., is there a compelling reasons(a root cause) to assume that stakeholders cannot agree on the interface protocol by 2/26/2013? *Not just pie in the sky.*
Risk Description

• Proper risk descriptions helps manage the right risks
  – Risk management is time and resource consuming
  – Managing “non-risks” is not cost effective

• Example
  – A risk may be identified as a risk that component YYY will be provided late
  – Writing this risk as:
    • IF component YYY is delivered late; THEN ...
  – May fail to inspire interest and action
    • The risk is too vague, or
    • There is no clear reason why this is a risk
  – In this case one needs to identify causal conditions that may prevent timely delivery of YYY. *If there are none this is not a risk!*
Risk Description

• Avoid writing the mitigation strategy into the risk description
  – A mitigation strategy is developed after the risk has been approved and analyzed

Examples

Requirements have always been a problem in passed projects within this organization.

IF requirements are not reviewed and verified;

THEN requirement defects will migrate into the design.

• Reviewed and verified are possible mitigation strategies
• Write the risk in a chain of cause, occurrence, consequence

Requirements have always been a problem in passed projects within this organization.

IF defective requirements are not discovered and corrected by PDR;

THEN requirements defects will migrate into the design and implementation causing rework, and cost and schedule impacts.

Al Florence - MITRE
Risk Description

- Risks must be written in a clear, concise and unambiguous fashion
- Words and phrases that may have confusing and multiple interpretations must be avoided

  - Adequate
  - Ad hoc
  - All
  - Always
  - Appropriate
  - Clearly
  - Easy
  - Existing
  - Fast
  - Flexible
  - Future
  - If required
  - Immediately
  - Large
  - Light
  - Limited
  - Near real time
  - Periodic
  - Portable
  - Rapid
  - Several
  - Slow
  - Small
  - Sometimes
  - State of the art
  - Sufficient
  - Usable
  - User-friendly
  - Weight
  - When required

Risk Analysis

• The risk is submitted to the Risk Management Board
• The risk is accepted or declined by the Board
  – If declined rational is conveyed to the submitter
• If accepted the Risk Management Board assigns:
  – A Risk Analyst responsible for conducting risk analysis on assigned risks
    • Supported by Subject Matter Experts (SMEs)
  – A Risk Owner responsible for ensuring risks are properly managed throughout their life
  – Risk Analyst and Owner could be one in the same
Risk Analysis Components

• Risks have the following components:
  – A future root cause(s) (yet to happen) which
    • if eliminated or corrected, would prevent a potential consequence from occurring
  – A probability of occurrence (or likelihood)
    • assessed at the present time and updated when necessary of the future root cause occurring
  – The consequence (or effect/impact) of that future occurrence
  – The time horizon during which the consequences will occur if the risk is not mitigated
• Risk Priorities
  • Mapping of probability of risk occurrence and risk consequence
• Risk Triggers
  • Specific events or conditions that indicate when to develop and execute mitigation or contingency strategies
Root Causes

• A future root cause is the most basic reason for the presence of a risk
• The cause of the risk has to be isolated and defined
  – Root causes should be initially identified when risks are identified
  – Once initial root cause are identified they may need to be analyzed further to determine the actual deep rooted causes of the risks
  – Root causes are documented and they support:
    • Establishing risk mitigation and contingency strategies
    • Improvement opportunities
• Root causes can also be referred as risk drivers

Root Cause Analysis. An analytical technique used to determine the basic underlying reason that causes a variance or a defect or a risk. A root cause may underlie more than one variance or defect or risk. (PMBOK® Guide) -- Fourth Edition) Syn: root-cause analysis
Root Causes

• Typical root causes may be associated with:
  - Threat
  - Requirements
  - Technical Baseline
  - Test and Evaluation
  - Modeling and Simulation
  - Technology
  - Logistics
  - Management
  - Cost
  - Schedules
  - External Factors
  - Budget
  - Earned Value Management
  - Production
  - Industrial Capabilities
Probability of Occurrence

• Probability of occurrence assessed, at the present time, is the probability of a future root cause occurring
• The chance of a risk occurring is rated on a scale between >0 and 1
• When the probability of occurrence = 1; (100%)
  – The risk has occurred; it then becomes an issue and is managed as an issue
• For most risks, estimating the precise probability of occurrence may be difficult
  – Analysis by SMEs may be necessary, and often using Best Engineering Judgment
Probability Scores

• Probability of occurrence may begin with a qualitative description of probability, which will tie to a numeric range of probability.

Sample Risk Probability Scores

<table>
<thead>
<tr>
<th>Probability Description</th>
<th>Probability % of Occurrence</th>
</tr>
</thead>
<tbody>
<tr>
<td>Very High (Extremely likely)</td>
<td>≥81% and =100%</td>
</tr>
<tr>
<td>High (Probable)</td>
<td>61% – 80%</td>
</tr>
<tr>
<td>Medium (Possible)</td>
<td>41% – 60%</td>
</tr>
<tr>
<td>Low (Unlikely)</td>
<td>21% – 40%</td>
</tr>
<tr>
<td>Very Low (Highly improbable)</td>
<td>&gt;1% – ≤20%</td>
</tr>
</tbody>
</table>
Consequence of Risk Occurrence (Impact)

- Risks are reviewed for the effect that they would have on the project’s objectives and other elements of the program.
- The level of impact, may be rated from very low (1) to very high (5), and is assessed against at least four categories:
  - Cost
  - Schedule
  - Scope
  - Performance
# Consequence of Risk Occurrence

<table>
<thead>
<tr>
<th>Program/Project Objective</th>
<th>Very Low Minor</th>
<th>Low Moderate</th>
<th>Medium Serious</th>
<th>High Critical</th>
<th>Very High Catastrophic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cost</td>
<td>Insignificant increase</td>
<td>Increase &lt; 2% of budget baseline</td>
<td>Increase 2–5% of budget baseline</td>
<td>Increase 6–10% of budget baseline</td>
<td>Increase &gt; 10% of budget baseline</td>
</tr>
<tr>
<td>Schedule</td>
<td>Insignificant slippage</td>
<td>Slippage &lt; 2% of project baseline schedule</td>
<td>Slippage 2–5% of project baseline schedule</td>
<td>Slippage 6–10% of project baseline schedule</td>
<td>Slippage &gt; 10% of project baseline schedule — OR — Slippage past a milestone mandated by Congress</td>
</tr>
<tr>
<td>Scope</td>
<td>Scope decrease barely noticeable</td>
<td>Minor areas of scope affected</td>
<td>Major areas of scope affected</td>
<td>Scope reduction unacceptable to sponsor</td>
<td>Project outcome is effectively useless</td>
</tr>
<tr>
<td>Performance</td>
<td>Performance degradation barely noticeable</td>
<td>Performance degradation noticeable, but does not fail acceptance criteria</td>
<td>Performance reduction requires sponsor approval</td>
<td>Performance reduction unacceptable to sponsor</td>
<td>Project outcome is effectively useless</td>
</tr>
</tbody>
</table>
Risk Exposure

• Risk exposure. (ISO/IEC 16085:2006 Systems and software engineering--Life cycle processes--Risk management)
  (1) the potential loss presented to an individual, project, or organization by a risk
  (2) a function of the likelihood that the risk will occur and the magnitude of the consequences of its occurrence

• Risk exposure can also be called Risk Priority
  – The priority of a risk helps to determine the amount of resources and time that should be dedicated to managing and monitoring the risk
  – Very Low, Low, Medium, High, and Very High priority is assessed by using probability and impact scores
  – The potential timing of a risk event may also be considered when determining risk management actions
Risk Priorities

Impact
Very High
High
Medium
Low
Very Low

Probability of Occurrence

Very Low Priority
Low Priority
Medium Priority
High Priority
Very High Priority
Very Low Priority Risks are placed in a Risk Watch List which are periodically monitored. Other Risks are monitored more aggressively.
Identifying Triggers

• Triggers are specific events or conditions that indicate when to execute mitigation or contingency strategies
• Unless a condition is immediate, a trigger should be defined
• Examples of triggers may include:
  – Cost performance
  – Schedule performance
  – Results of management reviews
  – Occurrence of the risk
    • as a trigger for execution of contingency strategies
Risk Response

• Risk response is the process of developing options and determining actions to enhance opportunities and reduce threats to the project’s objectives

• Risk response must be
  – Appropriate to the significance of the risk
  – Cost effective in meeting the challenge
  – Timely and realistic within the project contend
  – Agreed to by all parties involved

PMBOK
Risk Response

• Risk Responses has at least five components
  – Acceptance
  – Avoidance
  – Transfer
  – Escalate
  – Mitigate (*contingencies – for issues*)

• Acceptance – Accept the consequences of the risk occurring
  – Other responses may not be possible
  – Cost to respond may be greater than the benefit
  – May not be possible to prevent the impact if the risk occurs
  – Impact may be negligible
  – Risk may be imminent and should be handled as an issue
Risk Avoidance/Transfer

— Avoidance
  • Eliminate the sources of high risk and replace them with a lower-risk alternative
  • Avoid risks with good management and engineering practices

— Transfer - Shift the responsibility of managing and resolving the risk to another party
  • May be better able to manage the risk
  • May be the proper owner of the risk
  • Transfer could be from one party to another within the same organization
  • Transfer could be to a completely different organization
Risk Escalation

- Escalation - Risks should be managed at the lowest practical level
  - But conditions may arise where a risk should be escalated to higher levels of management or beyond the program/project
  - The next higher organizational (Governance) entity may be able to better to handle the risk/issue
  - Thresholds may exist that determine escalation
    - Cost of impact
    - Schedule effect of Impact
    - Scope of impact
    - Performance effect of impact
    - Time critical
    - Cost critical
Risk Mitigation

• Taking early action to reduce the probability and/or impact of a risk occurring is often more effective that trying to repair the damage after the risk has occurred

• Adapting less complex processes, conducting more tests, or choosing a more stable supplier are examples of mitigation actions

PMBOK
Risk Mitigation

• The following are important guidelines for effective risk mitigation:
  – Prepare detailed mitigation strategies for all medium, high and very high risks
    • With sufficient detail about what is to be done, when, where, and by whom
  – Develop mitigation strategies as early as possible, allowing time to address risks needing special attention or action
    • Helps reduce the chance of having high-priority risks appear at the last moment on the critical path
  – Prepare contingency strategies for all high and very high priority risks and risks imminent to occur
Risk Monitoring and Control

• In order to effectively monitor and control risks a Risk Repository needs to be established
  – Also called a Risk Register
• There are many risk tools that provide repository capabilities:
  – Home developed tools
  – Commercial tools
  – Corporate/agency tools

Note: Risk register implementation may depend on project size. A month long project might just need a spread sheet table whereas a multi-year, geographically dispersed project may require an internet and SQL-based database tool.
